SQL Sales Analysis

This report summarises selected findings from the query outputs shared for the project. Read the observations alongside the assumptions and limitations below.

- **Key Findings**

1. Revenue is concentrated in Bikes
Result: Bikes generated 28,316,272 in revenue (96.46% of total). Accessories contributed 700,262 (2.39%), and Clothing contributed 339,716 (1.16%).
Interpretation: Revenue is heavily weighted toward Bikes. Further analysis could compare units sold, customer mix and profit margins; revenue alone does not show profitability.

2. The United States and Australia lead country revenue
Result: The United States generated 9,162,327 (31.21%) and Australia 9,060,172 (30.86%). Together, they contributed 62.07% of revenue. The UK contributed 11.55%, Germany 9.86%, France 9.01%, Canada 6.74%, and records labelled n/a 0.77%.
Interpretation: The US and Australia are the largest revenue contributors in this dataset. Compare customer counts, average order value and product mix to understand the difference. Review the n/a country records for missing or unclassified data.

3. Most customers are classified as New under the current rules
Result: The query returned 14,631 New customers (79.15%), 2,198 Regular customers (11.89%) and 1,655 VIP customers (8.95%), totalling 18,484 customers.
Interpretation: New means the time between first and last recorded orders is under 12 months. VIP means lifespan is at least 12 months and total spending is above 5,000. Regular means lifespan is at least 12 months and spending is 5,000 or less. These are project-specific definitions, not standard industry labels.

4. Sales trends require like-for-like comparisons
Result: The shared monthly output shows a reported value of 1,874,128 for December 2013. The supplied output also shows only January for 2014.
Interpretation: Because some years appear partial and the original column headers were not included with the extract, avoid claiming full-year growth or decline. Compare equivalent periods and clearly label the metric before drawing conclusions.

5. Product performance should account for incomplete periods
Result: The shared product output includes Sport-100 Helmet Black sales of 69,895 in 2013 and 2,870 in 2014.

Interpretation: The 2014 output appears partial, so the lower value may reflect incomplete period coverage rather than a real decline in demand. Validate the time periods and calculation definitions before presenting product-level conclusions.

- **Summary**

The outputs show a revenue mix dominated by Bikes, strong revenue contributions from the United States and Australia, and a customer base where most customers fall into the project's New segment. These are descriptive findings, not causal conclusions.

- **Method Notes and Limitations**

- Currency was not specified in the supplied outputs, so revenue figures are shown without a currency symbol.
- Customer percentages are calculated from the 18,484 customer counts shared for this project.
- Customer segment labels follow the SQL CASE rules and should not be interpreted as standard industry definitions.
- The 2014 output appears partial; year-over-year conclusions should compare matching periods.

- **Suggested Follow-up Analysis**

- Calculate revenue contribution by customer segment, not only customer counts.
- Compare customer counts and average order value across countries.
- Investigate the n/a country records.
- Compare product performance over equivalent periods and validate average and year-over-year calculations.
- If available, add profit or margin analysis to complement revenue.
